

Syntactic parsing approaches

<https://eduassistpro.github.io/>

- ▶ Grammar-based approach with CKY decoding
 - ▶ PCFG, a generative approach that extends the Naïve Bayes Model
 - ▶ Lexicalization, parent annotation
 - ▶ Discriminative approaches: linear and neural
 - ▶ P
 - ▶ N
- ▶ Transition-based approach: the shift-reduce approach with greedy or beam search
 - ▶ Linear models with discrete features – linear
 - ▶ Random fields
 - ▶ Non-linear (neural) models
- ▶ Thinking out of the box: a sequence-to-sequence approach to syntactic parsing

Learning PCFGs

<https://eduassistpro.github.io/>

Parameters in probabilistic context-free grammars can be estimated by relative frequency, as with HMMs:

[Add WeChat edu_assist_pro](#)

<https://eduassistpro.github.io/>

$$P(X \rightarrow \alpha) = \frac{c}{C}$$

[Add WeChat edu_assist_pro](#)

E.g., the probability of the production $NP \rightarrow DET\ NN$ is the corpus count of this production, divided by the count of the non-terminal NP. This applies to terminals as well.

Grammar Refinement

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- ▶ Grammars extracted from treebanks (e.g. TreeBank) are often sensitive to ambiguity even with the w
- ▶ There are various ways to refine grammars with more expressive productions
 - ▶ Parent annotation
 - ▶ Lexicalization

Discriminative approaches with discrete features

- <https://eduassistpro.github.io/>
- ▶ The scores for each product of features and their weights,

<https://eduassistpro.github.io/>

$$s_j(X, \alpha, (i, j, k)) = \langle \mathbf{f}(X, \alpha, (i, j, k)), \mathbf{w}_j \rangle$$

where the feature $\mathbf{f}(X, \alpha, (i, j, k))$ and side X , the right-hand side or indices (i, j, k) , and the input \mathbf{w} .

- <https://eduassistpro.github.io/>
- [Add WeChat edu_assist_pro](#)
- ▶ The basic feature $\mathbf{f}(X, \alpha, (i, j, k))$ encodes only the identity of the production itself and is therefore as expressive as PCFG trained discriminatively.
 - ▶ Other features include the words in the beginning and at the end of the span w_i, w_{j+1} , the word at the split point w_{k+1} , etc.

Perceptron training

- ▶ Perceptron training for sequence labeling
- ▶ The feature vector for a sentence-tree pair decomposes to the sum of local features

$$\mathbf{f}(\tau, \mathbf{w}^{(i)}) = \mathbf{f}(\tau, \mathbf{w}^{(i)})$$

- ▶ Find the tree with the highest score based on the model

$$\hat{\tau} = \operatorname{argmax}_{\tau \in \mathcal{T}(\mathbf{w})} \theta \cdot \mathbf{f}(\tau, \mathbf{w}^{(i)})$$

- ▶ Update the feature weights

$$\theta \leftarrow \theta + \mathbf{f}(\tau^{(i)}, \mathbf{w}^{(i)}) - \mathbf{f}(\hat{\tau}, \mathbf{w}^{(i)})$$

CRF parsing

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- ▶ The score of a derivation $\Psi(\tau)$ can be converted to a probability by normalizing over all possible derivations.

<https://eduassistpro.github.io/>

Add WeChat $\tau' \in$ edu_assist_pro

- ▶ Using this probability, a WCFG can be trained to estimate the conditional log-likelihood of a labeled corpus.

CRF training

<https://eduassistpro.github.io/>

- ▶ Just as in logistic regression and the conditional random field over sequences, the gradient of the conditional log-likelihood is the difference between the observed and expected value of each feature.
- ▶ The expectation of the feature f_i is computed by averaging over all possible parse trees of the sentence s anchored at i .
- ▶ In CRF sequence labeling, marginal probabilities of bigrams are computed by the two-pass **backward algorithm**. The analogue for context-free grammars is the **inside-outside** algorithm, in which marginal probabilities are computed from terms generated by an upward and downward pass over the parsing chart.

Neural context-free grammars

- Neural network
- each span with a dense numerical vector. For example, the anchor (i, j, k) and sentence \mathbf{w} can be associated with a column vector:

$$\mathbf{v}_{(i,j,k)} = \text{Feed}(\mathbf{w}_{k-1}; \mathbf{u}_{w_k})$$

- The vector can be computed with a neural network

- The score of a constituent can be computed with a weight matrix

$$\psi(X \rightarrow \alpha, (i, j, k)) = \tilde{\mathbf{v}}_{(i,j,k)}^\top \Theta \mathbf{f}(X \rightarrow \alpha)$$

Parsing with the Transformer-based encoder-decoder framework

<https://eduassistpro.github.io/>

with the highest score with the CKY algorithm

Add WeChat edu_assist_pro

Score the candidate trees and search for the optimal one by the model

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- Assign a real-valued score $s(T)$ to each tree T such that the tree with the highest score is the optimal tree. Add WeChat: edu_assist_pro

<https://eduassistpro.github.io/>

where $s(i, j, l)$ is a real-valued score for a constituent C spanning the positions i and j with the label l . Add WeChat: edu_assist_pro

- Given the scores of constituent, the model-optimal tree can be found with the CKY algorithm.

Train the model with a max-margin objective

<https://eduassistpro.github.io/>

- ▶ Given the correct tree T^* , the model is trained to satisfy the margin constraints

[Add WeChat edu_assist_pro](https://eduassistpro.github.io/)

for all trees <https://eduassistpro.github.io/>

$$\max \left(0, \max_{T \neq T^*} [s(T) - s(T^*)] \right)$$

- ▶ Δ is the Hamming loss on labeled spans, and the tree that violates the most constraints is selected for purposes of updating parameters.

Encoder

- ▶ The encoder portion
 - ▶ A word-based portion that assigns a context-aware vector representation y_t to each sentence with Transformer (self-attention followed by position-wise feed-forward network)
 - ▶ The input is the sum of a word embedding e
 - ▶ A chart parser y_t to generate the scores for
 - ▶ Span score:
$$s(i, j, \cdot) = \Theta_2 \text{ReLU}(\overrightarrow{y}_{j+1} - \overrightarrow{y}_{i+1}) + \mathbf{b}_2$$
 - ▶ The input vector \mathbf{v} combines the word-based vectors:
$$\mathbf{v} = [\overleftarrow{y}_j - \overleftarrow{y}_i; \overrightarrow{y}_{j+1} - \overrightarrow{y}_{i+1}]$$
where \overleftarrow{y}_t and \overrightarrow{y}_t are the first and second half of the y_t respectively

Parser evaluation

- ▶ **Precision:** the fraction of constituents in the system parse that match a constituent in the reference parse.
- ▶ **Recall:** the fraction of constituents in the reference parse that match a constituent in the system parse.
- ▶ **labeled vs unlabeled** precision and recall. If the system must also match the label for each constituent, it is only required that the label match.

Transition-based Constituent Parsing

<https://eduassistpro.github.io/>

- ▶ A transition-based constituent parsing model is a quadruple $C = (S, T, s_0, S_t)$ where:
 - ▶ S is a set of parser states or configurations
 - ▶ T is a set of actions, e.g., *shift*, *reduce*, *close*, *accept*
 - ▶ s_0 is an initial state
 - ▶ $S_t \in S$ is a final state
- ▶ An action $t \in T$ is a transition function that takes the current state into a new state
- ▶ A state $s \in S$ is defined as a tuple $s = (\alpha, \beta)$ where α is a *stack* that holds already constructed subtrees, and β is a *queue* which is used to store words that is yet to be processed.

“Oracle”

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- ▶ The oracle is a sequence of actions that lead to the parse of a sentence.
- ▶ When training a gold parse tree t map <https://eduassistpro.github.io/>
- ▶ We can learn a model by comparing the oracle action sequences and update the param

The Perceptron learning algorithm

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- 1: **Input:** Training examples (x_i, y_i)
- 2: **Initialization:** Set $\theta = 0$
- 3: **for** $t \leftarrow 1$,
- 4: **for** $i \leftarrow 1$ to n ,
- 5: $z_i \leftarrow \sum_{j \in \text{GEN}(x_i)} \theta_j x_{ij}$
- 6: **if** $z_i \neq y_i$ **then**
- 7: $\theta \leftarrow \theta + f(x_i, y_i) - f$
- 8: **Output:** Parameters θ

Lexicalized transition-based parsing actions

- ▶ Each action t transitions a parsing state s into a new state.
 - ▶ **SHIFT** (st): remove the first word-POS pair from β , and push it onto the top of σ ;
 - ▶ **REDUCE-UNARY** ($X(st, y)$): pop the top subtree t from σ , construct a new unary node labeled with X , push t onto the new subtree, and then push the new subtree onto σ . The head of the new subtree is X .
 - ▶ **REDUCE-BINARY** ($X(st, y, z)$): pop two subtrees t and u from σ , combine them into a new tree w with X as the root, then push the new subtree back onto σ . The left (L) and right (R) versions of the action indicate whether the head of the new subtree is inherited from its left or right child.
- ▶ A parsing state $s \in S$ is defined as a tuple $s = (\sigma, \beta)$, where σ is a stack that is maintained to hold the partial parsing structures that are already constructed and β is a queue used to store unprocessed input (typically word-POS tag pairs).

Updating feature weights

<https://eduassistpro.github.io/>

Assignment Project Exam Help

$$\nabla_{\theta} \begin{pmatrix} p_0 tc = N - NP \sim \text{shift} & 1 \\ p_0 tc = N - NP \sim \text{reduce} & 0 \\ p_0 wc = \text{noodles} \quad NP \quad \text{shift} & 0 \\ p_0 wc = & 1 \\ p_1 t & 0 \\ p_1 tc = V - V \sim \text{reduce} & 1 \\ p_1 wc = \text{eats} - V \sim \text{shift} & 0 \\ p_1 wc = \text{eats} - V \sim \text{reduce} & 1 \end{pmatrix} \begin{bmatrix} -1 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

Notes: The feature $p_0 tc = N - NP$ predicts a “shift” action when the oracle action should be “reduce”.

Transition-based parsing features

Type	Feature Templates
	0 0 1 1 2
unigrams	$p_2 w c, p_3 t c, p_3 w c, q_0 w t, q_1 w t$ $q_2 w t, q_3 w t, p_0 l w c, p_0 r w c$
bigrams	$p_0 u w c, p_1 l w c, p_1 r$ $p_0 w p_1 w, p_0 w p_1 c, c$ $p_0 c q_0 t$ $q_0 t q_1 t$ $p_1 w q_0 w, p_1 w$ $c q_0 t$
trigrams	$p_0 c p_1 c p_2 c, p_0$ 1 0 0 1 $c q_0 t$ $p_0 c p_1 w q_0 t, p_0 c p_1 c q_0 w$

Baseline features, where p_i represents the i_{th} subtree in the stack σ and q_i denotes the i_{th} item in the queue β . w refers to the head word, t refers to the head POS, and c refers to the constituent label. p_{il} and p_{ir} refer to the left and right child for a binary subtree p_i , and p_{iu} refers to the child of a unary subtree p_i .

Feature vector

<https://eduassistpro.github.io/>

feature	count	feature	count
$p_0 tc = N-NP^{\sim} \text{shift}$	0	$p_0 tc = N-NP^{\sim} \text{reduce}$	1
$p_0 wc = \text{noodles}-NP^{\sim} \text{shift}$	0	$p_0 P^{\sim} \text{reduce}$	1
$p_1 tc = V-V^{\sim} \text{shift}$	0	$p_1 e$	1
$p_1 wc = \text{eats}-V^{\sim}$		$-V^{\sim} \text{reduce}$	1
$p_{0u} wc = \text{noodle}$		$\text{dies}-N^{\sim} \text{reduce}$	1
$q_0 wt = \text{with}-P^{\sim} \text{shift}$	0	reduce	1
$q_1 wt = \text{chopsticks}-N^{\sim} \text{shift}$	0	$\text{cks}-N^{\sim} \text{reduce}$	1
...

Notes: Feature count for one configuration. The total count for a sentence will be a sum over all configurations in the derivation of the syntactic structure of the sentence

Beam Search

Input: A POS-tagged s

Output: A constituent parse tree

```
1:  $beam_0 \leftarrow \{s\}$  ▷ initialization
2:  $i \leftarrow 0$  ▷ step index
3: loop
4:    $P \leftarrow \{\}$  priority queue
5:   while  $beam_i \neq \{\}$ 
6:      $s \leftarrow \text{pop}(beam_i)$ 
7:     for all  $p \in P$ 
8:        $s_{new} \leftarrow \text{apply } t \text{ to } s$ 
9:        $score_{s_{new}} \leftarrow \text{score}(s_{new})$ 
10:      insert  $s_{new}$  into  $P$ 
11:    $beam_{i+1} \leftarrow k \text{ best states of } P$ 
12:    $s_{best} \leftarrow \text{best state in } beam_{i+1}$ 
13:   if  $s_{best} \in S_t$  then
14:     return  $s_{best}$ 
15:    $i \leftarrow i + 1$ 
```

CFG based parsing vs transition-based parsing

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- ▶ A transition-based parser scores the actions while a PCFG based parsing model scores the rules
- ▶ It's customary to use the beam search algorithm for transition-based parsing
- ▶ The transition-based parser can be used for dependency parsing as well as graph-based parsing
- ▶ Learning for transition-based parsing basically any type of classifier, including neural network models

g
